Hello,

I write to you as Chief Privacy Officer of [Jumbo Privacy](#). We are a company that is premised on the philosophy that privacy of our mobile app users, and users we represent as authorized agent, is paramount.

It has come to our attention that the mobile application "[Care19](#)" is sharing data of its users to third parties, notably to Google, without disclosing such sharing explicitly in its privacy policy. In particular, it seems that Care19 shares with Google the following information:

- IDFA.

We are concerned for users that might be using Care 19, this is why we would like to understand what Google is doing with such information. Could you please indicate to us if Google is :

- storing the data shared by Care19 in a database? If so, for what duration and for what purposes?
- using the data shared by Care19 for any other purposes than providing anonymous and aggregated analytics to Care19, notably for advertising purposes?

In addition, can you please indicate if a person makes a data request to Google, by submitting his/her IDFA through Google's online process when complying with such request, will Google include the IDFA of such person received through Care 19 ?

Please note that we will publicly disclose such communication to our users.

Thank you,
Sincerely,
Zoé
